Bayesian Origins

Jason Preszler

Remember
Side A

The B side

Bayesian
Inference

Examples

References

In 1763, Rev. Thomas Bayes (posthumously) pub. paper containing:

Theorem (Bayes)

$$P(\theta|A) = \frac{P(\theta)P(A|\theta)}{P(A)}$$

$$\textit{Posterior} = \frac{\textit{Prior} \cdot \textit{Likelihood}}{\textit{Evidence}}$$

Using this for **inference** deeply concerns some people (but not Laplace, Gauss, Turing, or others).

All Bayesian methods follow the same procedure:

- develop prior probability distribution for our "hypothesis" or parameter values
- Find likelihood distribution of data given our hypothesis
- use Bayes theorem to construct posterior distribution

We then use the posterior to answer questions directly.

Typical example of drug or medical test

- Suppose everyone is either clean, C , or a drug user D .
- Let $+$ indicate a positive drug test and $-$ indicate a negative drug test
- It is believed that drug use is rare in the population, $P(D) = 0.01$
- Furthermore, the test has good sensitivity so $P(+|D) = 0.98$. The specificity of the test is also good, $P(-|C) = 0.95$.
-

$$\begin{aligned}
 P(D|+) &= \frac{P(D)P(+|D)}{P(+|D)P(D) + P(+|C)P(C)} \\
 &= 0.165
 \end{aligned}$$
